

fresh_extract — single self-contained model (run 11_fresh_f1)

Deep dual pixel encoders + symmetric per-level fusion → shared pyramid → two decoders (~50M params, bf16-AMP)

Bet 1: the HEIGHT decoder reads the shared pyramid → AlphaEarth (GEDI-LiDAR / DEM) reaches height FULLY — no throttled bridge

Objective (sm4tv): fraction = softmax4 + Tversky(a=0.5,b=0.7,g=1.55) + soft-Dice(k=5) | height = masked Huber(d=0.5) | binary = BCE+Dice . task weights f/h/b = 0.65 / 0.64 / 1.70
